Terminal Ops Delivery & UAT Platform (Jira)

A Jira space that simulates how a project coordinator in a logistics and terminal operations team captures requirements, prepares workshops, runs user acceptance tests (UAT), tracks issues and reports on progress. It combines a custom Kanban workflow, structured fields for stakeholder and root cause, automation rules and a KPI dashboard.

Jira space: Terminal Ops Delivery & UAT 2 (key: TODUAT2) **Tools:** Jira (team-managed software space), Jira Automation, Jira Dashboards

1. Work types and custom fields

Seven work types cover the tasks of an operations / project support role:

Work type	Purpose
Requirements	Capture business and technical needs as user stories
Workshop	Prepare and follow up workshops (agenda, protocol, next steps)
UAT Test Case	Test scenario with expected result
UAT Issue	Defect or finding raised during user acceptance testing
Training Materials	How-tos and short guides for users
Report Request	Data or report to prepare and check
Epic	Groups related work, for example one process area

Custom fields

Field	Type	Values
Stakeholder	Dropdown	Terminal, Logistics, IT/Product
Root Cause	Dropdown	Unclear Requirement, Process Gap, Data Error, System Bug, Training Gap
UAT Result	Dropdown	Passed, Failed, Re-test needed
Workshop Date	Date	Date of the workshop
Resolution Time (days)	Number	Days from creation to resolution

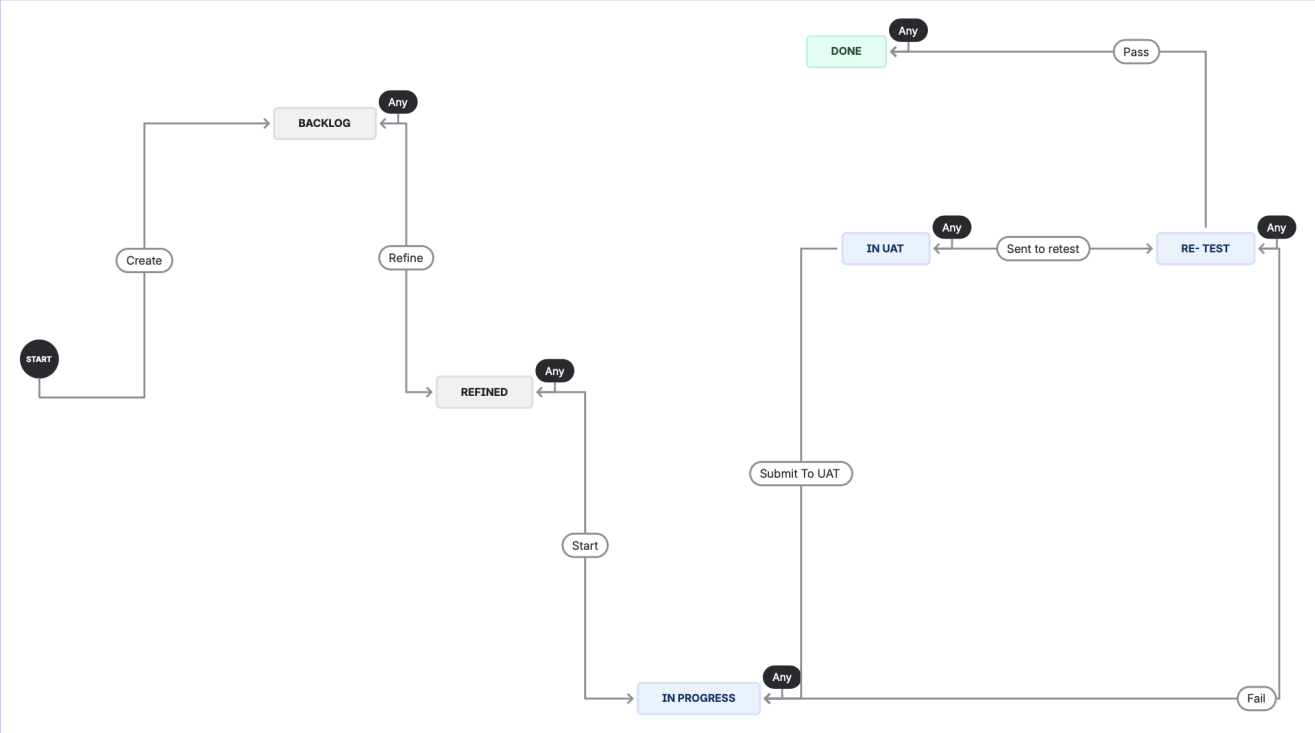

2. Custom workflow (Kanban board)

A 6-stage workflow that mirrors how a requirement or UAT finding moves from request to sign-off. Failed tests loop back through Re-Test instead of being closed.

Backlog → Refined → In Progress → In UAT → Re-Test → Done

Transition	From	To
Create	(new)	Backlog
Refine	Backlog	Refined
Start	Refined	In Progress
Submit To UAT	In Progress	In UAT
Sent to retest	In UAT	Re-Test
Pass	Re-Test	Done

Backlog, Refined, In Progress, In UAT, Re-Test and Done can also be reached directly from any status, so cards can be moved freely on the board.

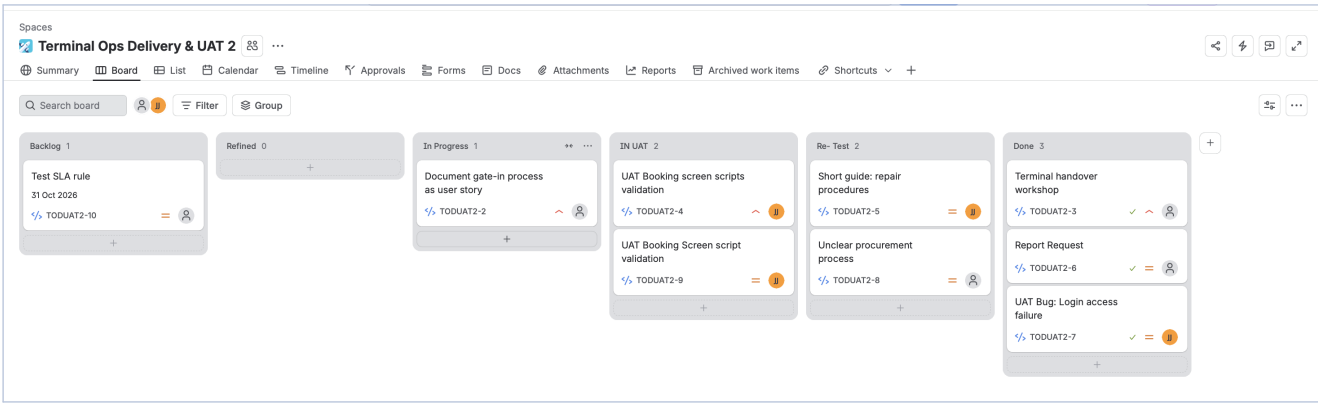

Workflow diagram with transition labels

3. Board and sample issues

Nine sample issues cover typical project-support work: documenting a process as a user story, a workshop, UAT scripts, a defect, a training guide, a report request and a test of the SLA automation. Each has a priority, stakeholder and root cause.

Key	Summary	Priority	Status	Root cause	Stakeholder
TODUAT2-2	Document gate-in process as user story	High	In Progress	Process Gap	Terminal
TODUAT2-3	Terminal handover workshop	High	Done	Process Gap	Terminal
TODUAT2-4	UAT Booking screen scripts validation	High	In UAT	Data Error	IT/Product
TODUAT2-5	Short guide: repair procedures	Medium	Re-Test	Training Gap	Logistics
TODUAT2-6	Report Request	Medium	Done	Data Error	Logistics
TODUAT2-7	UAT Bug: Login access failure	Medium	Done	System Bug	IT/Product
TODUAT2-8	Unclear procurement process	Medium	Re-Test	Unclear Requirement	Logistics
TODUAT2-9	UAT Booking Screen script validation	Medium	In UAT	Data Error	IT/Product
TODUAT2-10	Test SLA rule (due date set by automation: 31 Oct 2026)	Medium	Backlog	Process Gap	IT/Product

Kanban board: Backlog, Refined, In Progress, In UAT, Re-Test, Done

List view (scrolled right): Resolution, Created, Updated, Due date, Root Cause and Stakeholder

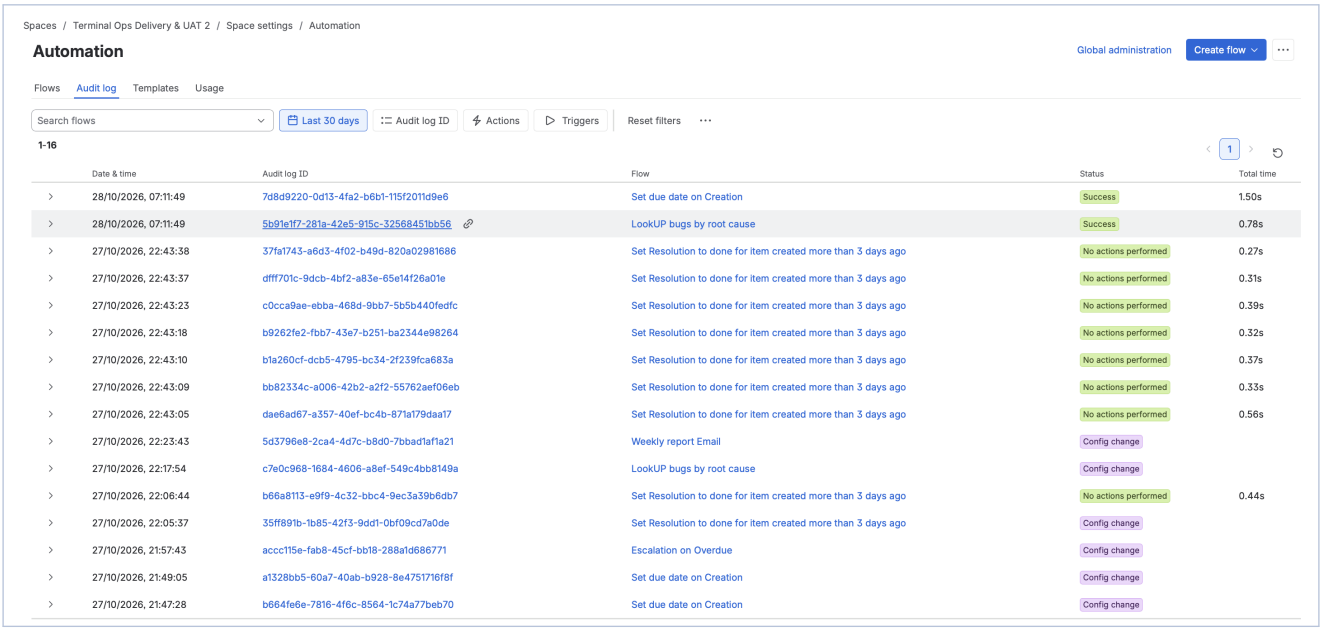

4. Automation rules

Five rules remove manual work and enforce deadlines:

Rule	Purpose	Status
Set due date on Creation	Sets a due date 3 days after an issue is created	Verified: TODUAT2-10 received 31 Oct 2026
Escalation on Overdue	Escalates open issues that pass their due date	Enabled
Set Resolution to done for item created more than 3 days ago	Scheduled check that sets the resolution on aged issues	Enabled; ran with no matching issues
LookUP bugs by root cause	Looks up issues with the same root cause to flag repeated problems	Verified: run succeeded
Weekly report Email	Sends a weekly summary of issue status by email	Enabled

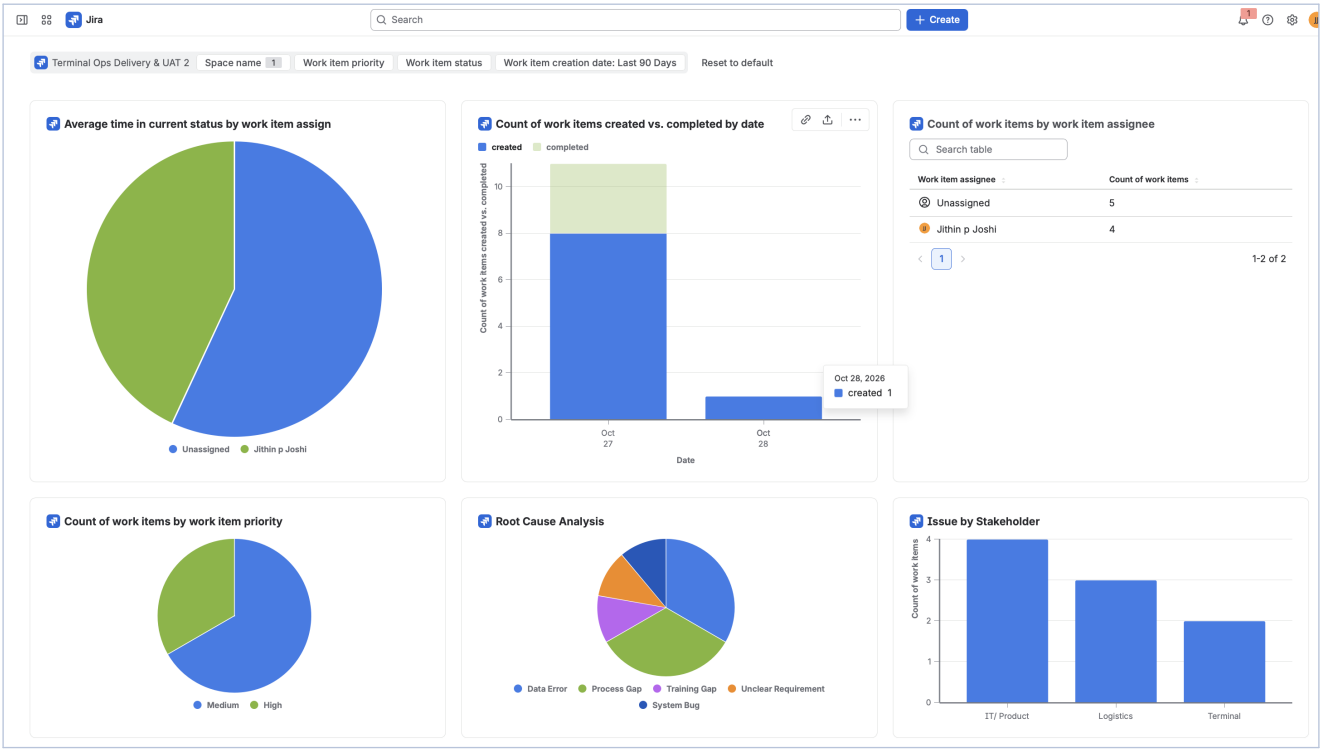

Automation rules in the space

Audit log: Success entries for Set due date on Creation and LookUP bugs by root cause

5. KPI dashboard

The Terminal Ops KPI dashboard gives a live view of delivery health: Root Cause analysis, issues by Stakeholder, Created vs Completed trend, priority distribution and average time in current status.

Terminal Ops KPI dashboard

What this project demonstrates

- Capturing requirements and UAT findings in a structured, traceable way
- A workflow that matches a real process, including a re-test loop
- Custom fields for stakeholder, root cause and priority tracking
- Rule-based automation for due dates, escalation and reporting
- KPI reporting with dashboards, ready to summarise for team updates and decision makers
